

AeroMechanical Services Ltd. (TSX-V:AMA) was founded in 1998 with the goal of perfecting an automated data collection and delivery service for aircraft operators. The company has become one of the world's leading providers of real-time data communications for the aerospace industry. AMA markets its products and services under the FLYHT™ brand.

INVESTMENT HIGHLIGHTS

- Unique line of patented products and services
- Increasing customer growth in flights, hours and aircraft types
- AFIRS key industry differentiator moving to next generation
- Recurring long-term revenue stream from installed base
- Strategic alliances with industry sector leaders
- High regulatory barriers to entry

AFIRS™ 228

ISSUE

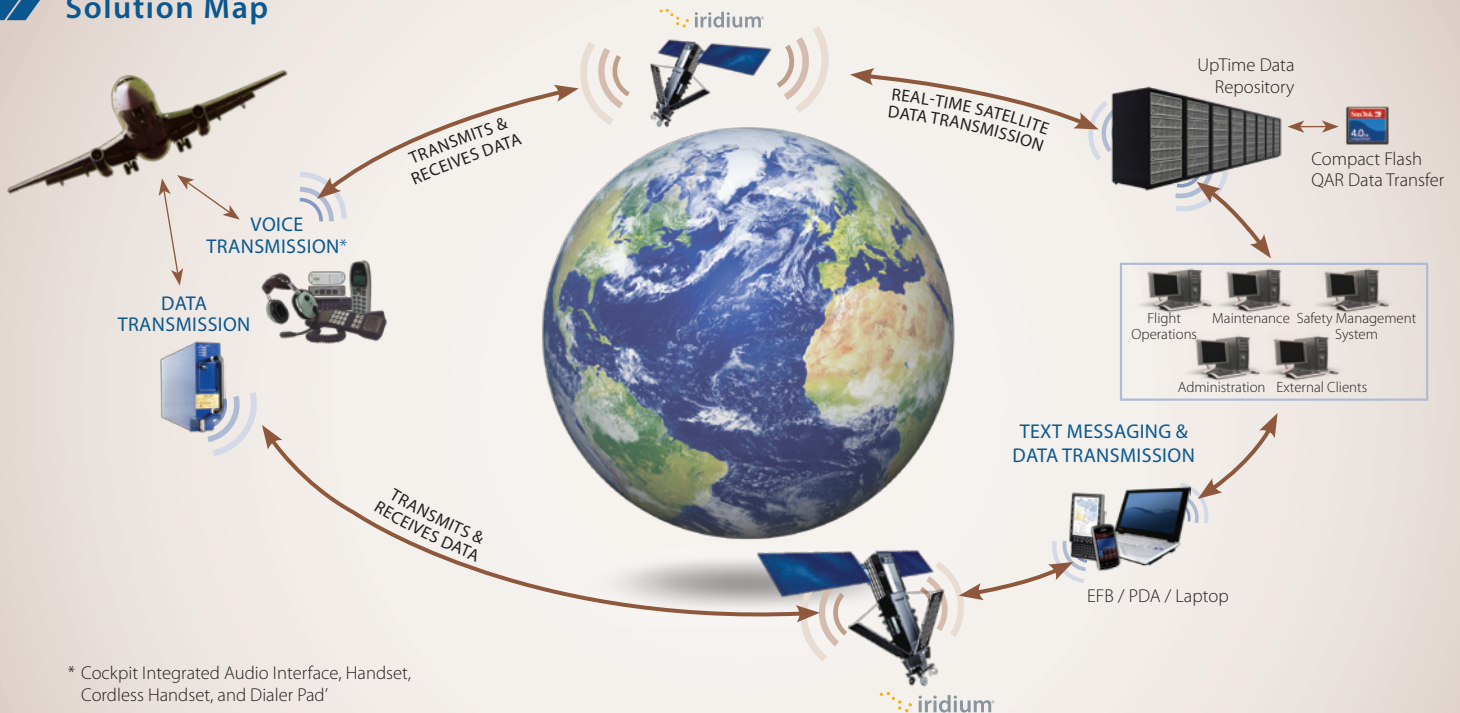

Current technologies cannot provide real time operations data, including location, on an aircraft in flight. The black box is a solution that only works when recovered, but not in real-time.

SOLUTION

AMA's AFIRS system installed on an aircraft monitors essential functions and transmits real time data to the ground anywhere in the world. It permits constant monitoring of an aircraft's location, efficiency and performance.

Solution Map

* Cockpit Integrated Audio Interface, Handset, Cordless Handset, and Dialer Pad

- **AFIRS™UpTime™** AMA's product centerpiece is the Automated Flight Information Reporting System (AFIRS). Introduced in 2004, AFIRS allows aircraft operators to manage and monitor aircraft operations anywhere, anytime, in real-time. AFIRS gathers, stores, and transmits data and UpTime, the client-web interface, delivers information in real-time reports to aircraft operators via e-mail.
- **AFIRS 220** has received regulatory certification for installation in approximately 30 widely used aircraft types. As of January 1, 2011 the total number of hours AFIRS 220 has flown on board all aircraft reached 700,000 hours. The next generation product, **AFIRS 228**, in the final stages of development, will offer new and improved features while remaining fully compatible with existing technologies.
- **FLYHTStream™** is an emergency data streaming mode that can be manually activated by the flight crew, ground support or automatically triggered by predefined emergency parameters. FLYHTStream sends critical data such as global position, equipment status and black box information to ground-based operations. This patent pending service uses the Iridium satellite network and UpTime data packets to stream this data to the ground, anywhere in the world in real-time.
- **FLYHT Fuel Management System** offers a powerful tool for aircraft operators to achieve cost savings. With this interactive application, aircraft operators can automatically identify fuel consumption trends and will not have to manually generate the required fuel management reports.

BARRIERS TO ENTRY

AMA holds patents or patents pending on all FLYHT products. In addition, installation of aftermarket electronic devices on aircraft must be authorized by government aviation regulators with a Supplemental Type Certificate (STC). AMA currently holds 30 approved STCs and another 15 are pending or in progress from Canada, the U.S., the European Community and China.
